

# What's In A Name?

Most companies offering CA use funny names to describe their products, after all what's in a name? Mercury however, takes naming seriously and has made it easy to choose the right product by placing the scientific viscosity or thickness right in the name. The middle number in the Mercury name is the key identifier, the smaller the number the thinner the product...*easy!*

**M5T** is the thinnest in the Mercury line with a viscosity of 5 (a viscosity of 1 would be similar to water).

**M300M** is our medium general purpose formula with a viscosity of 300.

**M1100G** is our gap filling formula.

**M100F and M1000F** are the Mercury Foam Friendly and low odor products.

**M3500FL** is a very thick viscosity and is flexible (thus the FL in the name)

**M100XF** is the result of nearly 2 years of lab work by Mercury Chemist and is the highest performance CA ever made, XF stands for Extra Fast.

**MH16** is a general purpose activator/accelerator that uses Heptane as a base chemistry (thus the MH16 name) for a better bond.

**M68DB** is the Mercury debonder that is specially formulated.

To Mercury, **"Made in the USA"** is a statement of freshness and trust. We don't play games by repackaging, blending or thickening foreign products trying to hang on to a false USA statement. Mercury products are actually **MANUFACTURED IN THE USA** and Mercury is the only CA produced in the USA. The Mercury manufacturing facilities are the largest producers of CA in the world! Check out the Mercury website for a video tour of our plant and remember freshness matters! Mercury is also the only CA product to carry an **unconditional unlimited replacement warranty**.
